FILE COVERS 1947 - 10 Aug 2001 VOL 135 ISS 8
FILE LAST UPDATED: 9 Aug 2001 (20010809/ED)

This file contains CAS Registry Numbers for easy and accurate substance identification.

This file supports REGISTRY for direct browsing and searching of all substance data from the REGISTRY file. Enter HELP FIRST for more information.

CAPLUS now provides online access to patents and literature covered in CA from 1947 to the present. On April 22, 2001, bibliographic information and abstracts were added for over 2.2 million references published in CA from 1947 to 1966.

The CA Lexicon is now available in the Controlled Term (/CT) field. Enter HELP LEXICON for full details.

Attention, the CA Lexicon is the copyrighted intellectual property of the American Chemical Society and is provided to assist you in searching databases on STN. Any dissemination, distribution, copying, or storing of this information, without the prior written consent of CAS, is strictly prohibited.

AN 1999-371129 [31] WPIDS

AB WO 9928486 A UPAB: 19990806

NOVELTY - A population of cells (A) comprising at least 60% CD7+CD34-lineage commitment marker-negative (Lin-) cells, are new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (1) a composition comprising (A) and a carrier;
- (2) a method of isolating hematopoietic stem cells from cells of a stem cell source comprising:
 - (a) contacting the cells of the stem cell source with antibodies

specific for lineage commitment surface antigens and CD34 surface antigen under conditions such that the antibodies can bind to said surface antigens present on the cells of said stem cell source;

(b) separating cells of the stem cell source bound to the antibodies from antibody-free cells of the stem cell source;

(c) contacting said antibody-free cells resulting from step (b) with anti-CD7 surface antigen antibodies under conditions such that said anti-CD-7 surface antigen antibodies can bind CD-7 surface antigen

present

on the antibody-free cells resulting from step (b); and

(d) separating anti-CD-7antibody-bound cells resulting from step (c) from anti-CD-7 antibody-free cells, said anti-CD-7 antibody bound cells being the hematopoietic stem cells;

(3) a method of isolating hematopoietic stem cells from cells of a stem cell source comprising:

(a) contacting said cells of said stem cell source with anti-CD7 surface antigen antibodies under conditions such that said anti-CD-7 antibodies can bind to CD7 surface antigen present on said cells of said stem cell source;

(b) separating cells of the stem cell source that bind the anti-CD-7 antibodies from cells that do not;

(c) contacting said cells that bind the anti-CD7 antibodies

resulting

in step (b) with antibodies specific for lineage commitment surface antigens and CD34 surface antigen under conditions such that said antibodies specific for lineage commitment surface antigens and CD34 surface antigen can bind lineage commitment surface antigens and CD34 surface antigen present on the anti-CD7 antibody-bound cells resulting from step (b); and

(d) separating cells free of antibodies specific for lineage commitment surface antigens and CD34 surface antigen resulting from step (c) from cells bound to antibodies specific for lineage commitment

surface

antigens and CD34 surface antigen, the former being the hematopoietic stem cells;

stem

(4) a method of effecting bone marrow transplantation in a patient, comprising isolating CD7+CD34-Lin- cells from a stem cell source and introducing the isolated cells into the patient under conditions such

that

engraftment of the introduced cells is effected;

(5) a method of effecting gene therapy in a patient comprising:

(a) isolating CD7+CD34-Lin- cells from a stem source;

(b) transforming said isolated cells with a nucleic acid encoding a therapeutically effective protein; and

(c) introducing the transformed cells into said patient under conditions such that the nucleic acid is expressed;

(6) a method of screening a test compound for its ability to promote differentiation, growth or engraftment of hematopoietic cells comprising:

(a) contacting CD7+CD34-Lin- cells with the test compound under conditions such that differentiation, growth or engraftment of the hematopoietic cells can be promoted; and

(b) determining whether the contacting results in promotion of differentiation, growth or engraftment of the CD7+CD34-Lin- cells; and

(7) a kit comprising antibodies specific for CD4, CD5, CD 13, CD33,

CD34, CD38 and CD25 **disposed** with one or more **container** means.

USE - The hematopoietic stem cells and methods are used for treating diseases and disorders, including genetic diseases and disorders and infectious diseases. The methods are also used to identify agents that promote growth engraftment or differentiation of stem cells.

L31 ANSWER 2 OF 4 WPIDS COPYRIGHT 2001 DERWENT INFORMATION LTD
AN 1998-103021 [10] WPIDS
AB EP 822404 A UPAB: 19980410

Optical illuminator comprises first housing having an internal cavity and a longitudinal axis, a second housing containing a laser source having a laser beam output and a collimating lens **disposed** in the laser beam output, mounted a fixed distance from the laser beam source to produce a collimated laser beam output. The second housing is adjustably coupled to the first housing so that the laser beam output passes through the housing cavity and is adjustable within a solid **cylinder** area to define a beam axis through the first housing cavity. A spatial filter comprising an objective lens has focal point, first aperture, and

a

collector lens mounted in a fixed location in the first housing cavity to intersect the beam axis. The first aperture is mounted in the first housing cavity a fixed distance from the collector lens in the beam axis, and the objective lens is secured within the first housing, movable along the beam axis to shift the focal point to a preselected location relative to the first aperture.

The spatial filter produces a spatially filtered collimated laser beam output. A beam shaping aperture is adjustably located in the first housing cavity and positionable to intersect the spatially filtered collimated laser beam output and shape the beam. A focusing lens assembly containing a focusing lens, is adjustably coupled to the first housing so that the focusing lens is positionable in the laser beam path to focus

the

shaped beam.

ADVANTAGE - Providing shaped, filtered beam in analytical instrument.

Factory alignment and low cost prealigned optical illuminator assembly is obtained, which can be easily oriented for use in instrument.

L31 ANSWER 3 OF 4 BIOSIS COPYRIGHT 2001 BIOSIS
1999:131929 Document No.: PREV199900131929. Artificial colloid tracer tests: Development of a compact on-line microsphere counter and application to soil column experiments. Niehren, Stefan (1); Kinzelbach, Wolfgang. (1) Inst. Hydromechanics Water Resources Manage., Swiss Fed. Inst. Technol., Zuerich ETH Hoenggerberg, HIL, CH-8093 Zuerich Switzerland. Journal of Contaminant Hydrology, (Dec. 15, 1998) Vol. 35, No. 1-3, pp. 249-259. ISSN: 0169-7722. Language: English.

AB Multi-tracer tests with both solutes and particles allow to parametrise heterogenous porous media on the basis of the dual porosity model. In soil

column experiments both solute and particle tracers were measured on-line at the outflow of the column. For the on-line measurement of particles we developed a flow **cytometer** with a sensitivity of one single

1 microsphere in 1 ml of water. The microspheres used are latex spheres of
 mum diameter, labeled with a fluorescent dye. The technique is based on
 the excitation of microspheres with a small diode laser. If a microsphere
 passes the laser focus the incorporated dye molecules emit fluorescent
 light. These photons are sampled by a Single-Photon-Counting
 Avalanche-Diode. The maximum flow rate through the instrument is 1 ml/min
 with a detection efficiency of up to 90%. The instrument is working
 stably
 over a time period of several weeks and has been tested under field
 conditions. The solute tracer we use is uranine, which is detected with a
 sensitive fluorimeter. Extreme sensitivity of the detectors is necessary
 to resolve tails of breakthrough curves which contain information on the
 structure of the medium. Laboratory columns were filled with a mixture of
 quartzsand (250-500 mum) and cellpore filter **cylinders** with an
 internal pore size of apprx 35 mum. The measured breakthrough curves
 show,
 that because of the highly reduced matrix diffusion of colloids, their
 first breakthrough can be up to 2.25 times faster than the first
 breakthrough of uranine.

L31 ANSWER 4 OF 4 WPIDS COPYRIGHT 2001 DERWENT INFORMATION LTD

AN 1991-126108 [18] WPIDS

AB DE 4033168 A UPAB: 19930928

The water used in a **cytometer** (biological cell measuring device)
 is handled by a system consisting of: - a pump-(1) which delivers the
 water from a **container** (2) to the flow chamber (3) and the focus
 point (6), and - a filter assembly (9) to which the water flows via a
 hopper (7) and a pipe (8) after leaving the focus area (6) and from which
 it returns to the **container** (2) through a pipe (10). The filter
 assembly (9) contains chemically active material (11) which absorbs the
 dye used to stain the biological cells, and mechanical filters (13) which
 remove the cells and other particles from the water.

USE/ADVANTAGE - This invention is used in the design of instruments
 in which measurements of biological cells in a water stream are made by
 passing the water through a focus point and measuring the resulting light
 scatter and fluorescence. The water used is recirculated and re-used many
 times, and the dangerous dyes in the water are absorbed, so that the
 proposed system has the advantages that the quantity of very pure water
 to be stored in the device is greatly reduced, and the **disposal**
 of water which has been contaminated by the dyes is avoided.

1/1

ABEQ GB 2244989 B UPAB: 19930928

A system for purification and recirculation of the water passing through
 a

flow chamber of a flow **cytometer** characterised by a) a pump (1)
 driving water from a reservoir (2) into the flow chamber (3) and through
 the excitation focus (6); and b) a composite filter (9) through which the
 water leaving said focus (6) by way of a funnel (7) and a tubing (8)

flows

back into said reservoir (2) through a tubing (10).

1/1

ABEQ US 5092989 A UPAB: 19930928

An appts. for providing sheath fluid filtering in a closed cycle flow
cytometer system comprises a flow **cytometer** having a

flow chamber, a water reservoir, a pump for moving water through a tube from the reservoir to the chamber so as to provide a jet, and a tube entering the chamber along its axis for introducing a suspension of cell sample material. The sample material includes at least cells, cell debris,

particulate matter or cell-staining dye.

A second tube communicates an outlet of the chamber with the reservoir for recycling water. The **cytometer** also has an excitation focus in the second tube between the chamber and reservoir arranged so that the jet of water carries the sample through that focus.

A

composite filter is provided between that focus and the reservoir.

ADVANTAGE - Less water is required in the **cytometer**.
